Genome and Gene Summary

Glycine soja isolate HAAS216 — Chloroplast Genome

1. Genome Summary

Feature	Result
Scientific name	Glycine soja
Isolate	HAAS216
Family	Fabaceae
Organelle	Chloroplast
GenBank accession	PX591265.1
Genome status	Complete genome
Genome length	152,222 bp
Topology	Circular
Number of FASTA sequence records	1
GC content	35.37%
A bases	49,270
T bases	49,107
C bases	26,485
G bases	27,360
Ambiguous bases (N)	0

2. Gene Summary

Examples of annotated chloroplast genes

Gene	Gene category	General function
psbA	Protein-coding	Photosystem II D1 protein
rbcL	Protein-coding	RuBisCO large subunit; carbon fixation
matK	Protein-coding	Maturase associated with intron splicing
atpB	Protein-coding	ATP synthase subunit
rpoB	Protein-coding	Plastid RNA polymerase subunit
ycf3	Protein-coding	Photosystem I assembly
petB	Protein-coding	Cytochrome b6f complex component
rps16	Protein-coding	Ribosomal protein

Gene Count Summary

Feature / measure	Count from complete GenBank record
Gene features	128 annotated gene features

Unique gene names	109
Protein-coding genes	76 unique gene names (83 CDS features)
tRNA genes	29 unique gene names (37 tRNA features)
rRNA genes	4 unique gene names (8 rRNA features)
Genes with split/joined CDS locations	12 unique names; includes trans-spliced rps12
Genes with split/joined tRNA locations	6 unique names
Duplicated gene names	19 gene names occur in more than one gene feature
Pseudogenes	0 annotated pseudogene qualifiers found in this GenBank record
